- ☐ `split()` string into chunks by delimiter:
`chunks = foo.toString().split('/');` // for example slash = '/'
the return 'chunks' is an array
- ☐ `node.js` can be used to process user form input on the server side.
- ☐ Dictionaries in three forms:
name/value pairs
property/value pairs
attribute/value pairs
- ☐ when opening a new page:
_self is default, overwrites current page
_blank is a new page, preserving the original
_parent is frameset of current frame (obsolete?)
_top breaks out of all frames into a new page
- ☐ In a form:
GET is default
POST is more sophisticated (and secure)
see w3schools.com for examples.
