■ Functions

After writing a function that does what you want, remember to call it, as JS won't do that for you.

The moment you wrap a chunk of code in braces, you become the caller.

■ Build a Text-Based Game

The colossal cavern adventure game.

Left, right, forward, back control movement

Down controls depth or level

Find the treasure and so forth.

I did this, but ended up building an image processor to build the maze using convolution to differentiate the edges. That was more fun than the game and suggests a web-based image processing project.

■ Scope (as in variables)

Scope literally means, 'who can see the variable definitions'.

External vars have global scope and can be seen by everyone

it is better to use `let` than `var` as the scoping rules are stricter.

'`let`' and '`const`' are thus preferred over the deprecated '`var`'.
